

ABSTRACT

Femoral prosthesis for the articulation of a femur (11) in  
a corresponding acetabular seating (13) of a hip,  
comprising at least a femoral head (12) of a hemispherical  
5 shape, which is inserted into the acetabular seating (13),  
and pin means (18) which are engaged and clamped in a top  
portion (21) of the femur (11). The femoral head (12) is a  
distinct and removable component with respect to the pin  
means (18) and the pin means (18) are provided with, or are  
10 associated with, coupling means (15, 115) which are  
inserted into a mating seating (14) of the femoral head  
(12) in order to obtain a removable constraint between the  
latter and the pin means (18).
